

WME REST SERVER FUNCTIONS

WME Rest Server can be started either as a service (WMERestService.exe) or as an executable (WMERestServer.exe). To change the version of the WMERestService.exe executable, you must uninstall the service from the Task Manager, replace the executable, and then reinstall the service. Detailed steps are available in the WMERestService.doc Installation & Upgrade documentation.

If errors occur when starting the service, a new system variable must be added. To do this, follow the steps: right click on My computer > Properties > Advanced system settings > Environment Variables. A new TNS_ADMIN variable needs to be added to System Variables and its value will be the path to the folder where the tnsnames.ora file is located. After that, a computer restart must be performed.

General settings

The operating parameters are set in Configurations > Settings > General.

The screenshot shows the 'Configurari' (Configurations) window with the '1 Generale' (General) tab selected. The window is divided into two main sections: '1 Generale' and '2 Securitate date' (Data Security).

1 Generale

- Port:** 8080
- Baza de date:** DBBOGDAN
- Nume user la rulare ca serviciu:** BOGDAN1
- Nume presc. firma:** RESTSERVER
- Interfata modul restaurant:** Restaurant deservit

 - Carnet facturi:** Factura fiscala.Simbol: RS.Subunitate: Sediu Central
 - Carnet livrari:** Dispozitie de livrare.Simbol: RS.Subunitate: Sediu Central

2 Securitate date

- Mod tratare sesiune REST:**
 - Sesiune este inchisa dupa fiecare interogare:**
 - Pooling conexiuni Oracle:**
 - Salvare informatii Request in fisier LOG:**
 - Response ContentType:** text/html

At the bottom right, there are two buttons: a green checkmark button and a yellow 'X' button.

REST session handling mode:

1. The session is closed after each query: NO / YES

The RestServer accepts a maximum of 32 sessions open simultaneously. If you choose **No**, there is a risk that when multiple users log in to RestServer at the same time, this limit of 32 will be reached. That is why it is good to set this flag to **Yes**.

However, there are also interfaces with the RestServer when the client application manages the requests from several users and then communicates on a single session with the RestServer. In this situation, setting the flag to **Yes** is unnecessary.

2. Pooling Oracle connections: NO / YES

If **NO** is selected, then a new connection is created each time you connect to Oracle. If **YES** is chosen, previously made connections can be reused, without involving the opening of a new connection with each call (for performance reasons).

3. Save Request information in Log file: if this option is checked, then the LogRequests folder will be created in the directory where the executable is located, where the files containing the imported JSONs will be saved.

4. Response Content Type: you can set application / JSON or text / html. When using Unicode characters, the text / html setting must be left.

Partners can be identified by: Internal Code, External Code or Fiscal Code.

Items can be identified by: Internal code, External code or Object code. The Object Code identifier cannot be used for the UpdateInfoArt function.

Imported invoices are saved in PDF format: the option is used for the UpdateIesiriClienti (Customers Outputs Update) function and has the effect of automatically exporting invoices in PDF format, after importing them into **WME**. The report version will be chosen for export. In **WME**, for the user who connects to WMRestServer, the Common list path constant will be set. The name of the exported file will be: Nrdoc_CodExternPartener.pdf. In WMRestServer.ini you can complete another version of the report for which you want automatic export - for items that have a warranty certificate (ListVerPDFAsoc = 186). It only works for WMERestServer, not for WMERestService.

Invoice numbering is done automatically: the option is used for the UpdateIesiriClienti function and has the effect of automatically allocating the numbers of output invoices. In the interface, an invoice book and a delivery book must be completed, from which the numbers will be assigned. The option works only if the import of invoices is made on Sediul Central (Headquarters).

Items without stock are discharged in value: the option is used for the UpdateIesiriClienti and UpdateTransferuri (Transfers Update) functions. If this option is checked, then on delivery of outgoing invoices and on transfers, a value accounting type without discharge will be completed, if for the items sent in JSON there is not enough stock. This accounting type must be completed in the constant Tip contabil implicit la onorare valoric (Default accounting type at value honour). The accounting type must not have price differences, the management method must be in value and must not have a Descarcare de gestiune (Division Discharge) check when leaving the company. If this option is not checked and there is not enough stock for delivery, a warning message will appear in WMERestServer and the invoices / transfers will be saved on Neoperat (Not Operated).

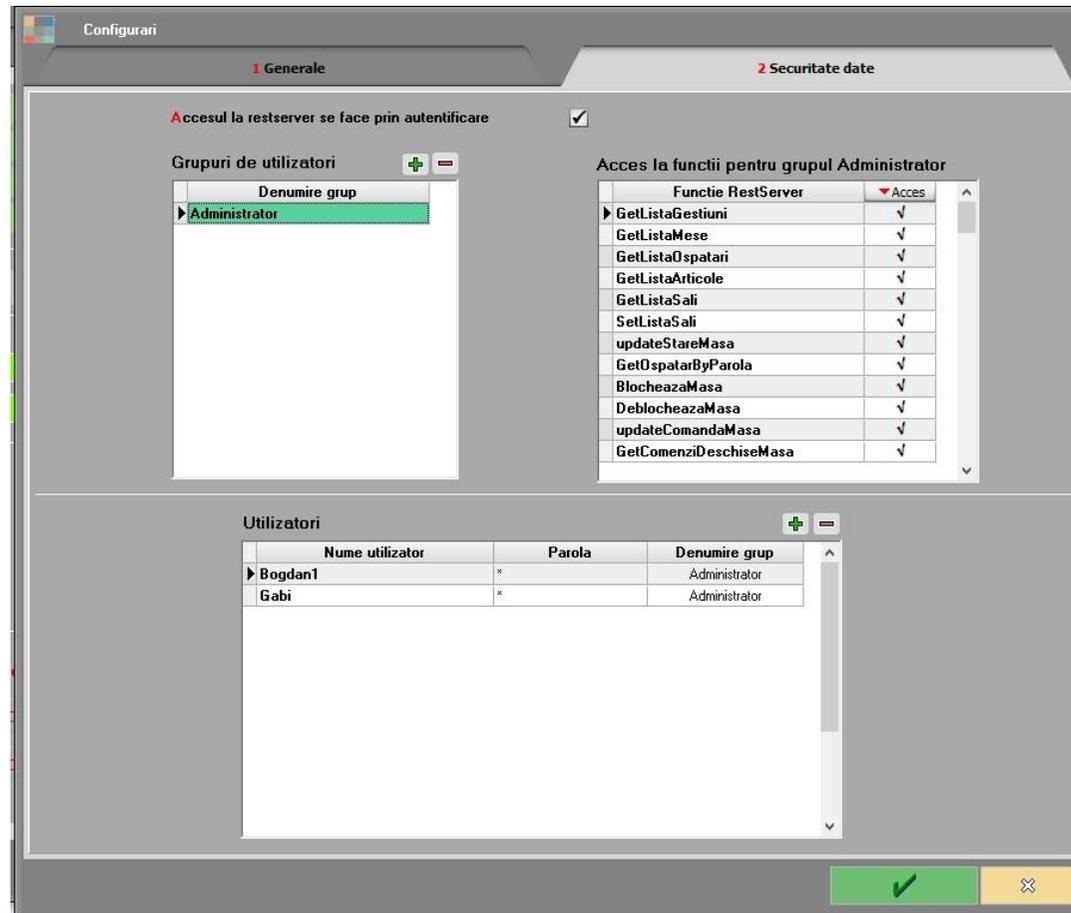

NOTE: The "Internal Function Name" that appears in the documentation is the name in the RestServer function view interface (Configurations> REST server function view). To view the functions, you must copy the CSS, Images, JS, Templates folders from ftp2.winmentor.ro / WMEnterprise / Documentatie / RESTSERVER / fisiere utile, next to the WMERestServer executable.

The UserName parameter used in functions can be null.

Data security settings

Security settings are set in Configurari > Setari > Securitate date (Configurations > Settings > Data security).

When the option "Accesul in RestServer se face prin autentificare" (Access to RestServer is done by authentication) is checked in the **Data Security** tab, user groups must be created and the RestServer functions with access must be set.

In the Users grid, users are created and passwords are set for each user group.

As an authentication technique, **WME RestServer** uses the Basic access authentication method (see https://en.wikipedia.org/wiki/Basic_access_authentication). This consists in the transmission of the following information by the client application in the header of the request: Authorization: Basic username: password, where the string resulting from the concatenation of the information username: password is coded in base64.

Example: for username=gabi and parola=123 the information that must appear in the header is: Authorization: Basic Z2FiaToxMjM=

Query functions, with complex parameters, can be called using the POST method with parameters in the Body. In this case, the name of the operation in the URL must be enclosed in quotation marks (character% 22).

Ex: Calling the function GetPlati

Returns:

<pre> { "result": "ok", "ErrorList": [], "DocumenteImportate": [{ "Numar": "9", "Serie": "RS", "Operat": "DA", "Codles": "197" }] } </pre>	<p>Result</p> <p>Error list</p> <p>Imported documents</p> <p>Number</p> <p>Series</p> <p>Processed</p> <p>Output code</p>
--	--

"result" can have the values "ok" or "error"

- If you want to automatically assign the numbers of outgoing invoices, you can check the " Numerotarea facturilor se face automat " interface. At the same time, an invoice book and a delivery book must be completed, from which the numbers will be assigned. It only works if the import is made on Sediul Central.
- If you want to automatically export invoices in PDF format after importing them into WME, then check the interface of WMRestServer " Facturile importate sunt salvate in format PDF " and choose the version of the list for export. In WME, for the user with which to enter the WMRestServer will be set constant: "Cale liste commune". The name of the exported file will be: Nrdoc_CodExternPartener.pdf. In WMRestServer.ini you can complete another version of the list for which you want automatic export - for items that have a warranty certificate (ListVerPDFAsoc = 186). It only works for WMERestServer, not for WMERestService.
- If the option **Articolele fara stoc sunt descarcate valoric** in the interface of the executable is checked, then on the delivery of the outgoing invoices, a value accounting type without unloading will be filled in, if for the items sent in JSON there is not enough stock. This accounting type must be filled in the constant "Tip contabil implicit la onorare valoric". The accounting type must not contain price differences, the management method must be valuable and the "Descarcare de gestiune la iesirea din firma: must not be checked. If this option is not checked and there is not enough stock for delivery, a warning message will appear in WMERestServer and the invoices / transfers will be saved on Not Operated.

```

"result" may take the values "ok" or "error"

- The accounting type on reception will be the default accounting type associated with the reception division.
- If the option **Articolele fara stoc sunt descarcate valoric** is checked in the executable interface, then on the transfers delivery a value accounting type without discharge will be filled in, if there is not enough stock for the items sent in JSON. This accounting type must be filled in the constant "Tip contabil implicit la onorare valoric". The accounting type must not contain price differences, the management method must be a value one and **Descarcare de gestiune la iesirea din firma** must be unchecked. If this option is unchecked and there is not enough inventory for delivery, a warning message will appear in WMRestServer and the the invoices/transfers will be saved on Neoperat (unsolved).

Upload files

Name of the internal function: **UpdateUploadFile**

Invocation mode:

URL: **http://host:port/datasnap/rest/TServerMethods/UploadFile**

Call type: POST

Body (example):

<pre>{"TipDoc":"3", "NrDoc":"88", "DataDoc":"21.07.2015", "IDPartener":"RO123456", "TipFisier":"PDF", "File":"....." }</pre>	<p>Document type Document number Document date Partner ID File type File – must insert Base64 coded file</p>
--	--

The function inserts the attachments only on documents forms and on the Parc auto form; for inserting the attachments on the Parc auto form, the JSON must be as follows:

<pre>{"TipDoc":"505", "NrDoc":""," "DataDoc":""," "IDPartener":""," "SerieCaroserie":"13", "TipFisier":"PDF",</pre>	<p>Document type Document number Document date Partner ID Body series File type</p>
---	---

"File": "..."}

Example of function in C Sharp:

```
using RestSharp;
private void load_file()
{
    var client = new RestClient("http://localhost:8085/datasnap/rest/TServerMethods/");
    var request = new RestRequest("UploadFile/", Method.POST);
    byte[] bytes = System.IO.File.ReadAllBytes("WME.pdf");
    string base64Text = System.Convert.ToBase64String(bytes);
    string data = " { \"TipDoc\": \"3\", \"NrDoc\": \"88\", \"DataDoc\": \"21.07.2015\", \"IDPartener\": \"RO777\", \"TipFisier\": \"PDF\", \"File\": \"\" + base64Text + \"\" } ";
    request.AddParameter("application/json", data, ParameterType.RequestBody);
    IRestResponse response = client.Execute(request);
    Console.WriteLine(response.Content);
}
```

Go to [Top document](#)

Adding external inventory

Name of the internal function: **UpdateStocExtern**

Invocation mode:

URL: **http://host:port/datasnap/rest/TServerMethods/StocExtern**

Call type: POST

Body (example):

```
[
  {"IDArticol": "Stoc8",
  "Cant": "300",
  "Pret": "40"},
  {"IDArticol": "3636",
  "Cant": "50",
  "Pret": "46"},
  {"IDArticol": "4646",
  "Cant": "20",
  "Pret": "80"}]
```

Item ID
Quantity
Price

]	
---	--

The external inventory will be visible in Info stoc, on Stoc suplimentar. If inventories for items not in the database are sent, they will be ignored.

Inventories query

Observation: it is possible to use the GetStocArticole and GetStocPeFurnizori functions without parameters; they retrieve the inventory for all the items in the divisions and classes configured on RestServer (the GetStocArticole Returns function and the minimum stock).

URL: **http://host:port/datasnap/rest/TServerMethods/GetStocArticoleExt /UserName/**

Call type: **GET**

Returns: unfiltered data

URL: **http://host:port/datasnap/rest/TServerMethods/%22GetStocArticoleExt%22/UserName/**

Call type: **POST**

The UserName parameter is not mandatory, but the // must be kept at the end of the URL.

Body:

[The list of items IDs for which inventories are interrogated:](#)

<pre>{ "Items": [{"ID": "11111"}, {"ID": "10"}] "Items": [{"CodIntern": "11111"}, {"CodIntern": "10"}] "Gestiuni": [{"Simbol": "DC"}] "DetaliuTipContabil": "DA", "TipuriContabile": [{"Simbol": "MD"}] "DetaliuDataAchiz": "DA" }</pre>	<p>Items – for ID identification Items – for Internal code identification Divisions – if you want to display stocks from a certain division Accounting type detail – if you want to detail the stocks by accounting types Accounting types - if you want to display stocks for a certain accounting type. Filtering only works if “DetaliuTipContabil”:”DA” Purchase date detail – if you want to display the purchase date for each stock</p> <p>// if the Array is void, all inventories are returned</p>
---	--

Returns: data filtered according to the criteria in the Body.

<pre>{ "Error": "ok", { "Data": [{</pre>	<p>Error Date</p>
